Summit X450a switch is an industry-leading converged Gigabit Ethernet aggregation switch with the ExtremeXOS modular operating system and optional dual 10 Gigabit Ethernet ports.

The Summit X450a series is based on Extreme Networks® revolutionary ExtremeXOS OS. ExtremeXOS modular OS is a highly resilient OS that provides continuous uptime, manageability and operational efficiency. Each Summit X450a switch offers the same high-performance, non-blocking hardware technology used on Extreme Networks BlackDiamond® 8800 series, in the Extreme Networks tradition of simplifying network deployments through the use of common hardware and software throughout the network.

The highly flexible and scalable Summit X450a switch is an ideal aggregation switch for traditional small core enterprise networks. The Summit X450a series is a perfect first level aggregation device for DSLAMs at a local central office before traffic is passed on to the Extreme Networks BlackDiamond 20808 or BlackDiamond 20804 core switch at the Point of Presence (POP) where traffic is managed and connected to service networks.

The extremely versatile Summit X450a switch provides high-density gigabit plus optional 10 Gigabit Ethernet ports in a compact 1RU format, supporting a full range of Layer 2 to Layer 4 functionalities on every port to allow high productivity. Optional redundant power supplies are offered with each switch to protect against power anomalies, providing a continuous operational network.

Target Applications

- Core switch for a small network
- Aggregation switch in a traditional three tiered network that requires high availability and ExtremeXOS advanced features
- Customer Edge (CE) or Provider Edge (PE) device in a Carrier Ethernet network
- Interconnect switch providing low latency connections for High Performance Cluster Computing (HPCC)

Voice-Class Availability

Powered by the ExtremeXOS, Summit X450a supports process recovery and application upgrades without the need for a system reboot. Summit X450a provides the high network availability required for converged applications.

Modular Operating System for Non-Stop Operation

True Preemptive Multitasking and Protected Memory

The Summit X450a series switch allows each of the many applications—such as Open Shortest Path First (OSPF) and Spanning Tree Protocol (STP)—to run as separate OS processes that are protected from each other. This drives increased system integrity and inherently protects against DoS attacks.

Process Monitoring and Restart

ExtremeXOS dramatically increases network availability using process monitoring and restart. Each independent OS process is monitored in real time. If a process becomes unresponsive or stops running, it can be automatically restarted.

Loadable Software Modules

The modular design of ExtremeXOS allows the upgrading of individual software modules, should this be necessary, leading to higher availability in the network (see Figure 1).

High Availability Network Protocols

Ethernet Automatic Protection Switching (EAPS)

EAPS allows the IP network to provide the level of resiliency and uptime that users expect from their traditional voice network. EAPS is superior to Spanning Tree or Rapid Spanning Tree protocols and offers sub-second (less than 50 milliseconds) recovery that delivers consistent failover regardless of the

number of VLANs, network nodes or network topology. Since EAPS allows the network to recover almost transparently, Voice-over-IP calls will not drop and digital video feeds will not freeze or pixelize in most situations.

Spanning Tree/Rapid Spanning Tree Protocols

The Summit X450a series supports Spanning Tree (802.1D), Per VLAN Spanning Tree (PVST+), Rapid Spanning Tree (802.1w) and Multiple Instances of Spanning Tree (802.1s) protocols for Layer 2 resiliency.

Software-Enhanced Availability

Software-enhanced availability allows users to remain connected to the network even if part of the network infrastructure is down. The Summit X450a series continuously checks for problems in the uplink connections using advanced Layer 3 protocols such as OSPF, VRRP and ESRP (ESRP supported in Layer 2 or Layer 3), and dynamically routes traffic around the problem.

Equal Cost Multipath

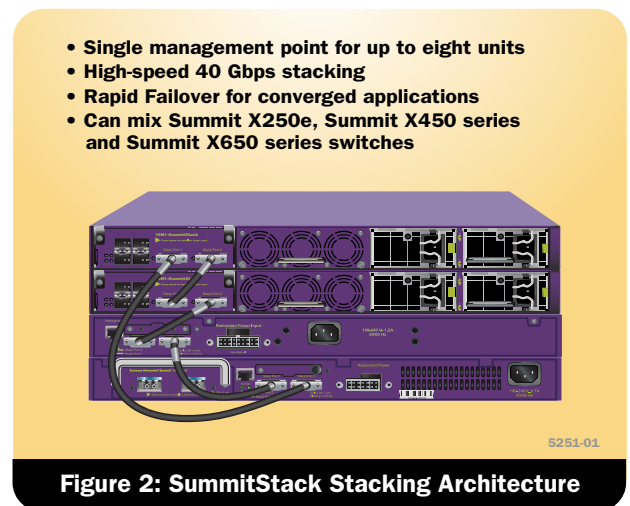

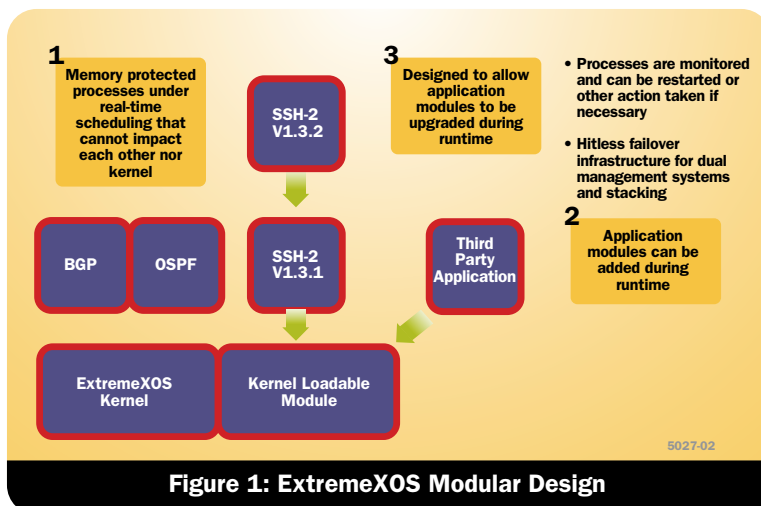

Equal Cost Multipath (ECMP) routing allows uplinks to be load balanced for performance and cost savings while also supporting redundant failover. If an uplink fails, traffic is automatically routed to the remaining uplinks and connectivity is maintained.

Link Aggregation (802.3ad)

Link aggregation allows trunking of up to eight links on a single logical connection, for up to 20 Gigabits per Second (Gbps) of redundant bandwidth per logical connection.

Voice-Grade Stacking with SummitStack

The Summit X450a series offers dual stacking interfaces to provide high-speed 40 Gbps stacking bandwidth. SummitStack stacking architecture is designed to support converged services such as VoIP and video by its highly available, rapid failover capability with n-1 master redundancy, distributed Layer 2 and Layer 3 switching, link aggregation across the stack and distributed uplinks. SummitStack supports up to eight units in a stack, and the mixture of the units can be Summit X250e, Summit X450e, Summit X450a, Summit X480 and Summit X650 switches. It provides sub-second failover for path failure and hitless master/backup failover along with hitless protocol support such as OSPF graceful restart and Network Login user authentication. The Summit X450a switch provides chassis-like management and availability with its SummitStack stacking technology (see Figure 2).

Advanced Features Offer Versatile Deployment

Combining superior resiliency, comprehensive security, and nonblocking performance, the Summit X450a switch is the cornerstone of a high-performance network. Summit X450a series provides a high bandwidth, non-blocking architecture with tri-speed copper Gigabit Ethernet ports for demanding Top-of-Rack data center applications. With optional 10 gigabit trunks, Summit X450a switches connect to gigabit edge devices and provide a high-performance aggregation layer in a traditional three-tier LAN. For Carrier Ethernet networks, Summit X450a switches deliver exceptional QoS and traffic management capabilities.

High Bandwidth, Non-Blocking Architecture for Demanding Edge Applications

When deployed as an access switch, Summit X450a, with its modular 10 gigabit integrated fiber gigabit ports, provides the bandwidth required by the most demanding applications. With more than 20 gigabits of uplink capacity, uplink bandwidth bottlenecks are eliminated. Providing line-rate throughput and supporting jumbo frames up to 9,216 bytes, Summit X450a allows transfers to be completed in minimal time.

High Density Gigabit Ports with Optional 10 Gigabit Uplinks

The Summit X450a switches provide ideal performance and functionalities for the aggregation layer. They eliminate the need to funnel traffic through a low bandwidth gigabit trunk by providing non-blocking 10 gigabit links to the core. As an option module, Summit X450a provides a variety of choices for 10 Gigabit Ethernet uplinks: dual port 10GBASE-T for UTP connectivity, dual port SFP+ for fiber and passive copper connectivity, dual port XFP and dual port XENPAK.

Link Redundancy Protocols

Aggregation switches are located in the network crossroads with high-density traffic from many users. Because of its location, every connection to and from an aggregation switch must be redundant in order to allow a safe failover of traffic to a secondary path in case of link or device failure. The Summit X450a series offers superior link redundancy features that provide a highly available aggregation layer.

For example, where voice-grade resiliency is required, EAPS allows links to failover rapidly so that voice call sessions are not dropped. Other link resiliency features include OSPF, ECMP and VRRP, providing standards-based Layer 3 dual homing, ESRP that offers dual homing at both Layer 2 and Layer 3, and a unique software redundant port that does not require any loop detection protocol and is easy to configure.

Advanced Routing Capabilities for Small Network Core

Supporting core deployments requires full protocol support. Summit X450a switches support advanced protocols for an efficient and productive small network core. The switches provide static, RIP and Edge-OSPF protocols with policy-based routing capabilities. An optional ExtremeXOS core license extends the feature set to include other important core functions such as:

- Full OSPF for much greater extensibility than RIP can provide
- BGP for inter-autonomous system forwarding
- PIM, sparse and dense modes for routing of multicast streams
- IPv6 hardware forwarding with OSPFv3
- IPv6 tunnels, IPv6-to-IPv4 translation, and IPv6 multicast discovery for extensive IPv6 support

Exceptional Policy-Based QoS and Traffic Management for Triple Play Services

The Summit X450a series provides eight hardware queues per port to support granular traffic classification, and up to 2,048 centralized ACLs per 24-port block that can use information from Layers 1 – 4 to prioritize and meter incoming packets at line-rate. When metering traffic, the switches can drop out-of-spec traffic or flag it for later action. To expedite upstream traffic handling, a packet's classification can be carried forward with Layer 2 (802.1p) and Layer 3 (DiffServ) markings. Summit X450a provides advanced traffic management features that support the high quality triple play of voice, video and data services.

Summit X450a switches support Extreme Networks vMAN tag stacking mechanism, which is compliant with the IEEE 802.1ad Provider Bridges standard. vMAN allows service providers to aggregate subscribers by using stacked Q-tags.

Summit X450a switches provide low latency and hardware-based support for multicast traffic, making them excellent solutions for IPTV deployment over Carrier Ethernet infrastructures. The DC-powered version of Summit X450a switches provides an internal DC PSU and an optional redundant PSU and can be deployed in a POP where AC is not available.

Comprehensive Security

Implementing a secure network means providing protection at the network perimeter as well as the core. Working together with Extreme Networks Sentriant® family of products, Summit X450a switches use advanced security functions in protecting your network from known or potential threats.

User Authentication and Host Integrity Checking

Network Login and Dynamic Security Profile

Summit X450a series switches support a comprehensive range of Network Login options by providing an 802.1x agent-based approach, a Web-based (agent-less) login capability, and a MAC-based authentication model. With these modes of Network Login, only authorized users and devices can connect to the network and be assigned to the appropriate VLAN. The Universal Port feature available in Summit X450a lets you implement Dynamic Security Profiles with Network Login and allows you to implement fine-grained and robust security policies. Upon authentication, the switch can load dynamic ACL/QoS for a user or group of users to deny/allow access to the application servers or segments within the network.

Multiple Supplicant Support

Converged network designs often involve the use of shared ports that represent a potential vulnerability in a network. Multiple supplicant capabilities on a switch allow it to uniquely recognize and apply the appropriate policies for each user or device on a shared port.

MAC Security

MAC security allows the lockdown of a port to a given MAC address and limiting the number of MAC addresses on a port. This can be used to dedicate ports to specific hosts or devices such as VoIP phones or printers, and avoid abuse of the port—an interesting capability specifically in environments such as hotels. In addition, an aging timer can be configured for the MAC lockdown, protecting the network from the effects of attacks using (often rapidly) changing MAC addresses.

IP Security

ExtremeXOS IP security framework protects the network infrastructure, network services such as DHCP and DNS, and host computers from spoofing and man-in-the-middle attacks. It also protects the network from statically configured and/or spoofed IP addresses. It builds an external trusted database of MAC/IP/port bindings so you know where traffic from a specific address comes from for immediate defense.

Identity Management

Identity Management allows customers to track users who access their network. User identity is captured based on NetLogin authentication, LLDP discovery and Kerberos snooping. ExtremeXOS uses the information to then report on the MAC, VLAN, computer hostname, and port location of the user.

Host Integrity

Host integrity checking keeps infected or non-compliant machines off the network. Summit X450a series support a host and endpoint integrity solution that is based on a model promoted by the Trusted Computing Group by interfacing with Extreme Networks endpoint security product, Sentriant AG.

Threat Detection and Response

CLEAR-Flow Security Rules Engine

CLEAR-Flow Security Rules Engine provides first order threat detection and mitigation, and mirrors traffic to appliances for further analysis of suspicious traffic in the network.

sFlow

sFlow® is a sampling technology that provides the ability to sample application level traffic flows on all interfaces simultaneously.

Port Mirroring

To allow threat detection and prevention, Summit X450a switches support many-to-one and one-to-many port mirroring. This allows the mirroring of traffic to an external network appliance such as an intrusion detection device for trend analysis or for utilization by a network administrator for diagnostic purposes. Port mirroring can also be enabled across switches in a stack.

Line-Rate ACLs

ACLs are one of the most powerful components used in controlling network resource utilization as well as protecting the network. The Summit X450a series supports up to 2,048 centralized ACLs per 24-port block based on Layer 2, 3 or 4 header information such as the MAC or IP source/destination address.

Denial of Service Protection

Summit X450a effectively handles DoS attacks. If the switch detects an unusually large number of packets in the CPU input queue, it will assemble ACLs that automati-

cally stop these packets from reaching the CPU. After a period of time, these ACLs are removed and reinstalled if the attack continues. ASIC-based LPM routing eliminates the need for control plane software to learn new flows, allowing more network resilience against DoS attacks.

Secure and Comprehensive Network Management

As the network becomes a foundation of the enterprise application, network management becomes an important piece of solution. Summit X450a supports comprehensive network management through Command Line Interface (CLI), SNMP v1, v2c, v3, and the embedded XML-based web user interface, ExtremeXOS ScreenPlay™. With a variety of management options and consistency across other Extreme Networks modular and stackable switches, Summit X450a series switches provide ease-of-management for demanding converged applications.

Extreme Networks has developed tools that help save you time and resources in managing your network. EPICenter® management suite provides fault, configuration, accounting, performance and security functions, allowing more effective management of Extreme Networks multi-layer switching equipment in a converged network.

Target Applications

Small Network Core Switch

Summit X450a is ideal as a small network switch. The optional 10 gigabit ports are perfect for setting up a high bandwidth 10 gigabit backbone, or for aggregating multiple gigabit ports for inter-switch connectivity. All necessary core protocols are available, including BGPv4 and IPv6. With non-blocking performance, extensive DoS protection, Longest Prefix Match routing and superior traffic management features, Summit X450a has been designed from the ground up to be an ideal small core switch.

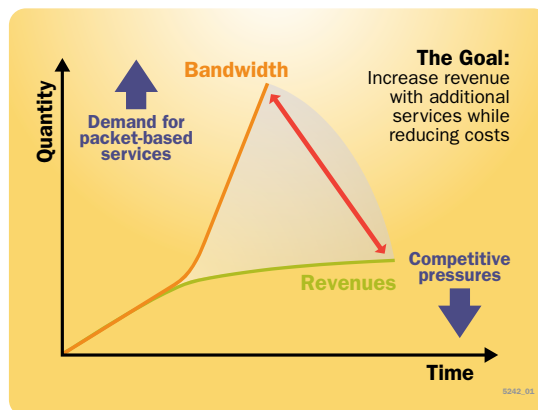

Traditional Aggregation Layer

Summit X450a is easily deployed as a technology upgrade to a traditional aggregation layer, bringing 10 gigabit uplinks and high availability. For copper and fiber deployments, a pair of Summit X450a switches provide redundant aggregation switching.

Carrier Ethernet Services

Summit X450a is an ideal service delivery platform for Carrier Ethernet networks. The advanced traffic management, resiliency and scalability features give it the flexibility to be deployed at the Customer Edge (CE) or as an aggregation switch at the Provider Edge (PE). By supporting both CE and PE service delivery requirements, Summit X450a minimizes service providers' operational expenses.

High-Performance Cluster Computing (HPCC)

HPCC consists of many servers working cooperatively to solve large computational problems. With the use of relatively inexpensive and compact 1RU servers, a significant amount of processing power can be cost-effectively packed into a relatively small footprint. Summit X450a series switches address the need for high-performance and cost-effective connectivity required for HPCC using gigabit and 10 Gigabit Ethernet as the interconnect technology.

Summit X450a Redundant Power Supply Units (PSUs)

EPS-500

EPS-500 is the redundant AC Power Supply for higher power consuming AC PSU based switches including Power-over-Ethernet enabled switches. EPS-500 is 1RU height and works as a standalone. EPS-500 can be rack mounted in a regular 19 inch rack system. EPS-500 comes with a DC output cable to connect between the Summit switch and EPS-500.

EPS-150DC and EPS-T2

EPS-150DC is the redundant DC Power Supply for DC PSU-based Summit switches. When installing it, the EPS-T2 power tray is required to rack-mount this external power supply. EPS-T2 power tray can take up to two EPS-150DC power modules, and each EPS-150DC works individually. EPS-150DC comes with DC output cable to connect between the Summit switch and EPS-150DC.
